GLB Inspector report

unreal_a.fbx • 171 KB • 10/26/2026, 1:22:03 PM

Dimensions & scale

Width × height × depth: 128.63 m × 181.50 m × 23.50 m

- CHECK 181.50 m across is large for a single asset. If it was modelled in centimetres, scale by 0.01 to get 1.29 m × 1.81 m × 23.5 cm.

Model health

Score: 92/100 (A, Game-ready)

Contents: 264 triangles, 1 draw calls, 1 materials, 0 textures, 1 animations, 22 joints

GPU memory (est.): 37 KB

- CHECK 68 static animation channels — Channels whose value never changes still cost memory and CPU every frame.
- 1 primitive without an index buffer — Unindexed triangles duplicate shared vertices; welding and indexing reduces memory.

Rig

Joints / skins: 22 / 1, root pelvis

- OK 1 skin found, 22 joints total
- OK 1 skinned primitive, 792 skinned vertices
- OK Every skinned vertex has at least one non-zero joint weight
- OK Joint weights sum to 1.0 on every vertex
- OK No duplicate joint names within any skin
- OK Every skin's joints form a single connected hierarchy
- OK 1 animation clip reference this rig (not played back here — see Animation Inspector)

Humanoid & retargeting

Humanoid bones: 15 / 15 required

Naming: Unreal Mannequin

Bind pose: A-pose (arms 45° from horizontal)

- OK Unity (Humanoid avatar): All 15 required bones found, so it should map automatically.
- OK Unreal (IK Retargeter): Uses UE Mannequin bone names, so it lines up with the stock Mannequin IK Rig.
- Mixamo animations: Not Mixamo bone names; Mixamo animations need retargeting (Unity Humanoid or an Unreal IK Retargeter can do this).

Notes

- Converted from FBX to GLB first.
- The model is 181 units across; FBX files are often in centimetres. If it comes out 100 times too big, rescale it by 0.01.

Not run: Anims, Compare.
